Clause/Subclause/Annex: Part 4/7.4.2.4

Paragraph/Figure/Table/Note: p. 5122

Type: te

(5)	(6)
Comment (justification for change) by the MB	Proposed change by the MB
Escape mechanism does not define escaping for “_” character.	Add escaping definition for “_” character.

Proposed Disposition

Agreed; the following changes will be made in Part 4, §7.4.2.4, page 5,122, lines 2–6:

This element defines a binary basic string variant type. For all characters that cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format `_xHHHH_`, where H represents a hexadecimal character in the character's value. *[Example: The Unicode character 8 is not permitted in an XML 1.0 document, so it shall be escaped as `_x0008_`. end example]* To store the literal form of an escape sequence, the initial underscore of this escape sequence shall itself be escaped (i.e. stored as `_x005F_`). *[Example: The string literal `x0008` would be stored as `_x005F_x0008_`. end example]*
